

DATA VISUALIZATION

Visualize, map and management of your CMDB assets is vital for any successful business.

Today, your CMDB is the focal point for storing and maintaining asset information within your organization. A unified CMDB presents a challenge to users looking to visually map and control assets while ensuring compliance in a complex IT/Business environment.

It is important to offer business users a **“simplified at-a-glance”** overview of relationships and interdependencies of their CI/Asset data.

e-Vis™ provides the full benefit of a federated configuration management database with the simplicity of drag-and-drop visual mapping. Enjoy unprecedented visibility into your business infrastructure (and linked components).

Name	Value
Name	SVR001
CMDB ID	CMDB001
Status	In Use
Description	Windows Server
SOX applies	Yes
ISEC applies	Yes
Criticality	Vital
Serial #	AB-2842467995
Usage	Commercial
Class Type	Central IT
Super-Class	Servers

CMDB : Configuration Management

Designed from the ground up to be simplified, easy to use and user-friendly while delivering unparalleled visibility into **your** CMDB database structure.

Graphical representations of **your** asset infrastructure includes of linked mapping of complex relationships.

CMDB Visualization means functional Business Intelligence:

We help our customers maximize real business value utilizing our CMDB technology, while at the same time minimizing risk. As CMDB is a key component of ITIL, so it is with our application integration.

Accelerating best practice implementation of our CMDB means adoption of a mature real-time business tool key to providing critical business decision support and improved asset management.

- View data from multiple servers
- State-of-the-art CMDB data visualization engine
- Launch-in-context
- CI and relationship dynamic filtering
- Upstream and Downstream visual linking
- Graphing capability with a small memory footprint

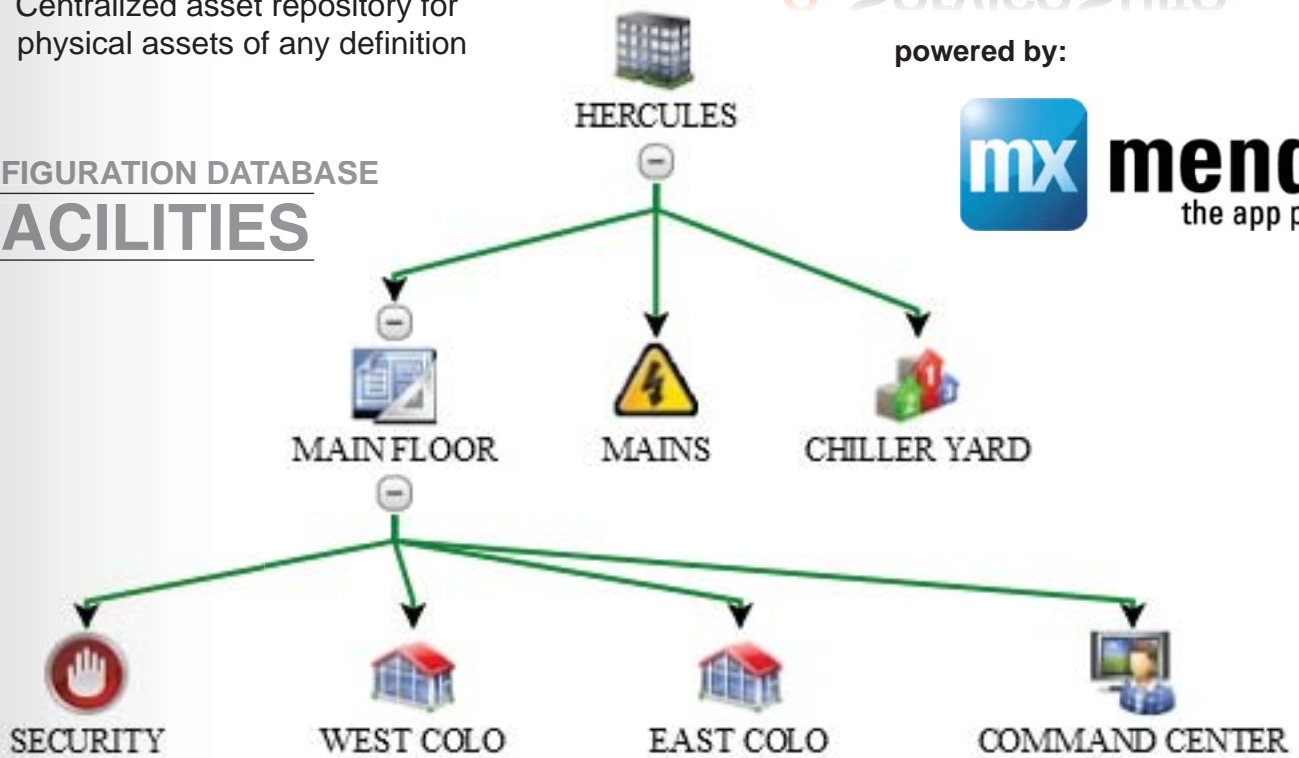

- Intuitive and easy-to-use interface
- Seamless integration with Service Desk and Change Management
- Customizable relationship definition and setup
- Historical audit trail and Service History records
- Centralized asset repository for physical assets of any definition

e-ServiceSuite's scalable architecture supports large numbers of IT assets, configuration items and users, while allowing quick access to information.

Our CMDB leverages Service Oriented Architecture (SOA) and Web Services to provide real-time integration between disparate systems.

This facilitates improved efficiency, streamlined IT processes and expanded business service capabilities.
